Vaughan's Seed Store

CHICAGO

NEW YORK

Through Vaughan's You Can Buy the Cream of the Dutch Bulb Crop

With Ocean Freight, Duty, Cases and Packing Paid

Our Dutch bulbs are purchased through large orders placed with growers of proved reliability with whom we have been dealing for many years. We require special grading, and packing, and insist upon trueness to type. This insures us top quality, by which you benefit.

Our prices to you include packing, cases, duty and ocean freight, all of which are added above the invoice price on imports made direct, and must be paid in cash on delivery. Handling charges in Holland are up 100 per cent over prewar, and ocean freights have increased 150 per cent. Experienced florists have learned that when they buy from us, they are assured of top quality, at lowest prices, when all costs are considered.

All orders for Holland Bulbs placed with us before July 1st at open prices will receive a special Import Rate.

Advices from Holland are that though weather has been unfavorable, the bulb crop is good and prices stiffening. Exports to all countries are expected to be larger. Hyacinths, though plentiful, are so much in demand that prices are rising. Lilies, except for rubrum, are somewhat lower than last year. We recommend that all your needs be covered promptly, since late purchases are more likely to cost you more, than less.

Secrets of Success in Forcing Fall Bulbs

Success in forcing tulips, narcissi, hyacinths, and iris in greenhouses and cold frames is largely dependent upon temperature control. All the factors which influence healthy growth are discussed in the following digest. It combines the basic principles originally established by scientific investigation in Holland, with the results of long experience in producing and forcing tulips under conditions prevailing in the United States. Every florist who attempts to grow these bulbs in a greenhouse or cold frame should be familiar with the facts which follow.

PRINCIPLES OF GROWTH ON TULIPS AND NARCISSUS

In forcing bulbs exact temperature control must be maintained for optimum results. Following are some of the growing principles that must be followed to get consistently good results from year to year.

When you receive bulbs from us, initiation of their flower buds is complete, and the floral parts may be examined by cutting a few bulbs horizontally with a knife and examining with a microscope. All the parts of the flower should be visible including petals, stamens and pistil. To find the flower bud, start cutting the bulb in the center and gradually work down by small segments in layers. The leaves will surround the flower, and will be cut first, and should not be confused with the flower parts. Most varieties respond best to 68° F until the bud has been initiated in the bulb. After bud initiation 48° F is the proper storage temperature.

Precooling is the procedure of controlling the temperature so that the leaves, stem and flower bud elongate most rapidly in proper balance with one another. Most varieties respond best at 48° F for the elongation period. Vaughan's precooled bulbs have been given the optimum elongation temperature, as soon as possible after bud initiation has been complete, so that the best and earliest blooms possible can be obtained.

PROCEDURE FOR GROWER TO FOLLOW

Upon receiving either precooled or regular Tulip bulbs, plant them at once and grow them as close to 48° F temperature as possible until the shoots are about 2 to 3 inches high. When the plants are **at least** 2 to 3 inches high they may be moved to the greenhouse bench at listed dates for each variety. When the shoots start to emerge, it is wise to spray all flats or pots with a solution of fermate made in the proportion of 1 pound of fermate to 100 gallons of water with 4 ounces of Grasseli S. S. 3 combined spreader and sticker. This spray will control and prevent the spread of fungous diseases

including Botrytis, or tulip "Fire". A dust of 50% sulfur and 50% hydrated lime can also be used with good results particularly as a preventive. This dust should be applied freely after each watering until the flats or pots are removed to the growing bench.

Tulip bulbs can never be "**forced**" without taking unnecessary chances of white tip, bud blast or soft, poor quality bloom. If the temperature control has been followed as above, the best and earliest bloom will result without growing at above 60° F. Only certain varieties respond favorable to precooling and early forcing, and poor results will be obtained if late varieties are put in the growing bench too soon. Bulb seasons vary as to their early forcing qualities, and it is necessary to play a little on the late side by a week or so rather than risk the entire crop. 60° F means Day and Night temperatures, and we recommend growing the first two weeks in the bench at 55° F. We have seen bulbs grown at 60° F come perfectly one week after those grown at 67° F had white tip and blasted buds. We recommend the following varieties for early bloom in order of benching and earliness. Single Early and Mendel tulips come into bloom early but their substance generally does not come up to Cottage or Darwins. Approximate dates follow.

PRECOOLED TULIPS

	Benching	Blooming
Albino	November 30	January 1
Golden Harvest	December 10	January 10
Rose Copeland	December 10	January 10
Wm. Copeland	December 10	January 10
Wm. Pitt	December 20	January 20
Bartigon	December 31	February 10

REGULAR TULIPS

Albino	December 14	January 21
Golden Harvest	December 21	February 1
Rose Copeland	December 21	February 1
Wm. Copeland	December 21	February 1
Wm. Pitt	December 31	February 10
Bartigon	January 10	February 20

Varieties may be held for later blooming by continuing the growing at 48° F until the plants are almost ready to bloom in storage or by growing cooler than 60° F on the bench. Tulips should be planted in well drained soil, and not over watered or under watered. They will need more frequent waterings on the bench than in storage. Any well balanced fertilizer improves the color of foliage and flowers, but do not use an overdose.

If it is impossible to plant bulbs at once on their arrival, at least unpack and store them as close to 48° F as possible. Nothing will spoil them faster than temperatures above 70° F.

If you are going to grow them in a cold frame, pick a site with good drainage and water with cold water thoroughly before placing the flats or pots. A shady spot is preferable so that the sun does not keep the soil temperature high during possible warm Fall days. Cover the flats or pots with 3 or 4 inches of sand so that sprouts will not be broken easily when the time comes for moving into the greenhouse. Where winters are severe, put on a heavy layer of leaves or straw just before hard freezes are apt to come in your temperature zone. Spray the tops of pots or flats with Fermate mixture or dust with sulfur mixture on bringing into the greenhouse. Grow day and night at 60° F or below; or 55° F at night and 63° F during the day. Generally speaking tulips grown in storage that is too cold will grow too short with large flowers; if grown in storage that is too warm the flowers will be small on thin, weak stems. Extreme heat in the greenhouses, any temperature from 67° F and up, may cause buds to blast or flower tips to turn white, and have poor color. If the plants become dry at any stage of growth bud blast will result.

IRIS

Iris bulbs do not have the flower buds initiated until the plant is approximately 2½ inches high in growth and large sizes only may be used for early flowering. Upon receipt of Iris Wedgewood 10 ctm. and up you should plant them and grow at 55° F, not higher, in the bench or in storage; 48° F would be acceptable but delays growth about one week. After the plants are 2½ inches high they should be definitely moved to the greenhouse and the day or night temperature should never be allowed to go above 60° F. Iris need lots of water and can not withstand dry soil conditions. Plant the bulbs shallow in deep flats. Late varieties or small sized Iris bulbs should be grown more slowly at about 45° to 50° F until about two weeks before blooming time when the temperature may be raised to 60° F days and 55° F nights. Plant Iris in deep flats so the roots have plenty of room, and the plants require good light conditions. Foliage may be trimmed as necessary to allow more light and decrease evaporation and drying out of flats, benches or pots.

NARCISSUS KING ALFRED

Plant all Narcissus bulbs as soon as received. Bulbs should be grown at 48° F until the shoots are 2 to 3 inches long at least. It does not hurt them to be left in much longer. Precooled King Alfred may be put on the bench as soon as they are 3 inches long. Grow at 60° F for three weeks and finish at 65° F. Narcissi like well drained soil, but water freely when heavy foliage growth is in crop. November 28 should be about the proper date to set precooled stock on the bench from the bulb cellar or cold frame. Regular stock of King Alfred should

follow 2 to 3 weeks later, continuing with other varieties as their foliage indicates on forcing types.

HYACINTHS

Hyacinths if not planted immediately should be stored at 70° F in a dry place. Delayed planting is permissible for getting quality blooms late. Grow at 50° F in storage until the flower bud is entirely out of bulb at which time transfer to greenhouse for growing on gradually, increasing the temperature up to 70° F over a period of two weeks.

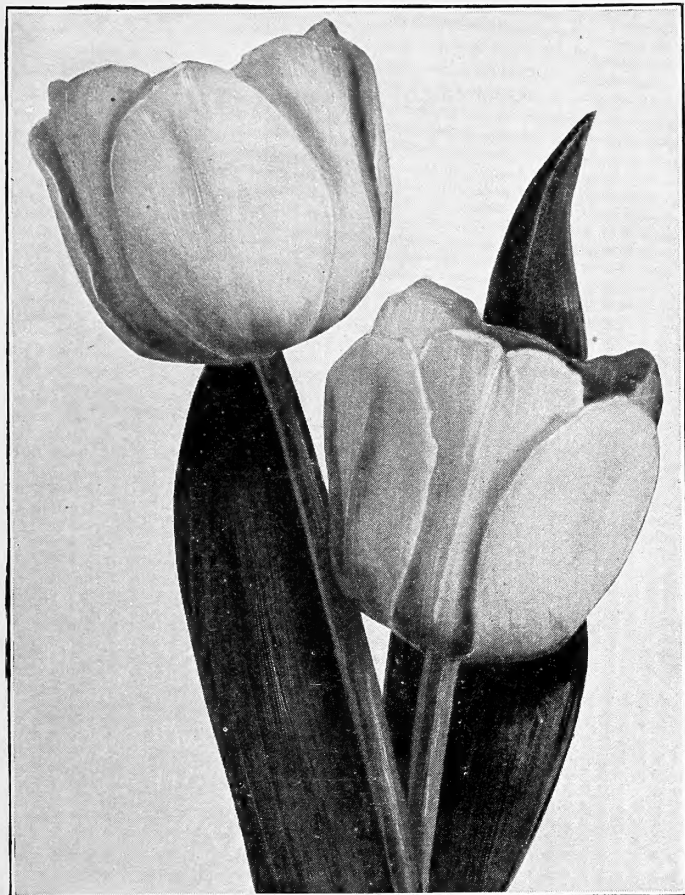

BULB CULTURE SUMMARIZED

The principal points for success with bulb stock of Tulips, Iris and Narcissus are:

1. Order and plant Tulips and Narcissus on time from September 1 to October 15. Best results out doors are obtained from these planting dates also.
2. Use moist soil in planting bulbs, and plant shallow so there is plenty of food and room for the roots. Water well after planting.
3. After unpacking as soon as received, store bulbs as close to 48° F as possible. Bulbs give off heat; in closed containers this can be serious.
4. Plant as soon as possible, and grow at 48° F until plants are 2 to 3 inches high. All bulbs should be well rooted before being brought into greenhouse. 48° F is a good rooting temperature. If bulbs have heaved up in the flats or pots by their rapid rooting, they should be pressed down again with careful handling.
5. In the greenhouse grow cool, never above 60° F early, or 65° F for last two weeks of growth.
6. Do not allow flats or pots to dry out.
7. Do not plant Iris too close on benches, 3 inches apart in 4 inch rows is about right, or 3½" x 3½" in flats.
8. Use preventive spray or dust on Tulips.
9. Watch out for bright days raising house temperatures above maximum allowed. Nothing will spoil them faster than temperatures above 70° F.
10. Get to know varieties.
11. Buy from a reliable source where honest size of bulbs, and true varieties can be expected on delivery.
12. Overhead heat is best for bulb culture as pipes under the bench often heat the plants more than the house thermometer indicates. Where pipes under the bench are used it is wise to string a roll of wrapping paper about a foot high above the edge of each side of the bench. This prevents warm air from circulating up around the side of the bench and drying and heating flats along the edges.
13. We have found dusting bulbs with Spergon is a good preventive of rooting troubles in Tulip culture, particularly in late field plantings.
14. Check your thermometers for accuracy. It is not unusual to find thermometers 5 degrees off and this could ruin a bulb crop run at 65° F close to maximum.

Imported Hyacinths of Good Quality

Last year was the first time we were able to offer Imported stock since 1939. The demand was very heavy and large quantities were imported. With fertilizers scarce in Holland the crop is not going to be as large and prices are now advancing, so we urge you to order at once.

At present prices hyacinths offer to the florist one of the best opportunities to grow at a minimum risk and cost pot plants of first quality, which can be sold at good prices in the spring market.

L'INNOCENCE

GRAND MAITRE

NARCISSI—AMERICAN AND HOLLAND GROWN

Our Holland-grown bulbs will come from a grower that has kept up his stocks even after the U. S. embargo went into effect in 1926, because of a good demand from other countries.*

Our American-grown bulbs are grown in Oregon, and Washington where narcissi bulbs grow best. All our stock has come from the same source in the last fifteen years. The most modern implements are used so that bruising and disease are reduced to minimum. After digging, our bulbs are stored in temperatures that have been found most satisfactory by eminent English and Dutch experimenters. This temperature treatment hastens the flowering period and keeps the bulbs firm.

One of our representatives makes an inspection each season when the bulbs are in bloom and again after the bulbs have been lifted and placed in trays in the warehouses. Therefore our customers are assured of the best quality.

Vaughan's American Grown Lily Bulbs

From the beginning of the new lily growing industry in the United States, Vaughan's Seed Store has taken a prominent part in its development, and has contributed to the improvements in culture and handling methods to which this infant industry owes its present success. We shall continue to lend all possible aid to the expansion of growing operations, and to encourage careful growers, who prove capable of producing the high quality stock which is demanded by our customers.

CREOLE LILIES

(Certified Louisiana Grown.)

LOUISIANA QUEEN

In Louisiana Queen, we offer the cream of the Louisiana crop. The bulbs are certified by the state entomologist to have less than 1 percent (1%) fleck. Contrast this with the fact that many fields inspected by our bulb buyers show fifty to eighty percent fleck. Such stock does not produce satisfactory bulbs for greenhouse forcing, as the flowers come deformed or split.

Our bulbs will be kept at the proper temperature while being packed for shipment in refrigerator cars. We expect to have some bulbs ready for planting in September to produce flowers in January and February.

SHANGRI-LA LILIES

Can be obtained only from Vaughan's Seed Store.

They come to you with live roots like Croft lilies from the Pacific coast.

Accurately checked scientific tests have shown that they produce twice the bud count of ordinary rootless Creole bulbs of comparable size, because they start growing without check, or taking time to produce new roots.

Culture is like other Creoles, growing cool to keep down their height, and for best quality. The variety is naturally early.

All Shangri-La Bulbs are exceptionally high crowned.

All bulbs will be shipped to you from cold storage after treatment to facilitate forcing. In ordering state whether you want bloom for January, Easter or later, so we can ship at the proper time, from Oct. 1 to May 1.

MEXICAN LILIES

Temperature Control Protects Crop

Paul R. Krone, of Michigan State College, writes in the June, 1946, issue of "Under Glass":

One of the best lots of Easter Lilies that I saw last spring was a batch of Mexican lilies at the Coy Kendall range in Belleville, Michigan. The bulbs were potted up late in January and carried at a 68 degree continuous temperature. They made Easter beautifully and there were virtually no splits or blasted buds.

This lot of plants certainly bears out Dr. Post's assertion made a year or so ago that a major factor in the blasting of Lily buds is a low soil temperature combined with a high air temperature. He discovered that when lilies are subjected to 50 degrees or lower in the greenhouse at night and this is followed by a bright sunny morning, 100 per cent of the buds are blasted.

He ascribed the difficulty to lack of water since the water loss from the top of the plant is rapid in the sun and the intake of water from the cold soil is slow, resulting in insufficient water in the plant.

Mr. Coy Kendall says that the bulbs should be potted by January 10, but that the temperature should not be allowed to drop below 65°. Dr. Post says that no danger is involved until the buds are visible and from then up until a week before blooming. He recommends that where it is necessary to drop night temperatures below 60° to hold the crop for Easter, the temperature should be raised to 60 degrees at least two hours before the sun strikes the buds.

Bulbs $2\frac{1}{2}$ inches and more and are sure bloomers.

ANEMONES

One of the most showy flowers, good for cut flowers. They thrive in any soil except a very heavy clay. Set 10 inches apart, about $\frac{1}{2}$ inch deep. Sunny location, plenty of moisture. **De Caen**, number one bulbs, per 100, \$3.75; per 1,000, \$32.50.

Anemone St. Brigid Irish Champions. The largest flowered strain of Anemones ever offered in the United States. Large, brilliant flowers in a wide variety of colors, over 90% full double. Number one bulbs, per 100, \$4.00; per 1,000, \$36.00.

CHIONODOXA (Glory of the Snow)

These are among the most beautiful of our spring-flowering bulbs, coming into bloom soon after the snow is gone. Grows well in any good garden soil, and when once planted requires no further care. Looks best when planted in lines or clumps.

Lucillae. Flowers of a brilliant sky-blue color with white center. Per 100, \$1.75; per 1,000 \$12.00.

Sardensis. Deep blue. Per 100, \$1.75; per 1,000, \$12.00.

Mixed, per 100, \$4.50; post paid; per 1,000, \$40.00.

WHITE CALLA

(Aethiopica) Ready in September

Callas being natives of swampy regions grow to best advantage where there is an abundance of moisture, and are therefore very difficult to handle in the curing. Some growers practice **premature cutting off the tops**, expose bulbs to the sun, in order to make early shipment.

Our stock is **thoroughly cured in the ground and dried carefully** before they are packed. This means **later delivery** but better results can be obtained from such bulbs.

We caution forcers of Callas to water this stock sparingly after planting because Calla bulbs store up considerable moisture.

PRODUCING BETTER SEEDLING PLANTS

A new growing material to use in place of soil, called mineralite, promises to end many of our problems in germinating fine seeds. Mineralite is a form of mica and is made by roasting a special kind of mica ore until it expands or pops like popcorn.

After heating, the grains of mineralite are porous—a single particle less than 1/4" in diameter may have thousands of tiny holes. These pores trap so much air that it is practically impossible to drown out seeds grown in this material. At the same time, it holds many times its weight in water, so that when handled right, seeds don't dry out. These two things—plenty of air and plenty of moisture—are the most difficult parts of the growing operation to control.

Mineralite also controls damping-off. Because it is roasted at more than 2,000 degrees, the damping-off fungus as well as other forms of life that might cause trouble are destroyed. Also, all soluble chemicals are driven off, so that mineralite can't hurt growing plants.

By using mineralite with proper heat controls as a substitute for soil, and by watering as soon as the first true leaves appear with liquid fertilizers, the grower has complete control over every single thing that affects plant growth.

Several methods of using mineralite have been worked out. You can replace ordinary soil with mineralite in any method of growing that has worked well for you in the past. The only difference is that as soon as the first pair of true leaves can be seen, mineralite will have to be watered with a solution of liquid fertilizer to supply the food found in soil. We have found that Hy-Gro, a complete fertilizer which includes the minor elements, is effective when used with one level teaspoonful to a quart of water. Most annuals should be watered twice with this solution before setting out.

An effective way to use mineralite was developed by Dr. Neil Stuart of the Beltsville Experiment Station. An ordinary flat is lined with a tray made out of black paper (The ready-made tray made by the Bird Mfg. Co., fits a standard size flat). This tray is only one inch deep, so that no matter how much water is applied, the mineralite does not become saturated.

An ordinary clay flower pot is placed in the center of the flat on the black paper tray. Mineralite is then poured around this pot. After planting, water is poured in the flower pot until the surface of the mineralite looks slightly damp. (Usually, the pot should be filled four or five times.) In many cases it does not need further watering until after the seedlings are showing, since the tray forms a reservoir that keeps the whole flat moist for days.

In our own tests, we find that either straight mineralite used in place of soil, or 50-50 mineralite and soil will give better results than soil alone. The mixture is not quite as disease-free as straight mineralite, but there is much less trouble from damping off than in soil alone.

No special technic is needed to sow seed in mineralite. Broadcasting over the surface seems to be satisfactory even with seeds that we ordinarily think need to be covered. One of the surprising things about seedlings grown in straight mineralite is the enormous mass of hair roots produced. This usually comes free with a wad of the mineralite attached. Don't try to wash off or brush off this material or you may damage the roots. It is because of this mass of roots (which is usually left behind when seedlings are sown in soil) that mineralite-grown seedlings recover so quickly after transplanting. The correct size of mineralite particle is important.

Growing Cuttings in Mineralite

Mineralite is better than sand for rooting cuttings. It allows just as much air to get to the cutting as sand, yet holds so much moisture that it needs watering only about one-fifth as often. Because of closer moisture control, cuttings root quicker. More of the roots are saved because they come free with the cutting instead of remaining behind in the sand. Because of the high heat used in processing it, it does not contain fungi which cause damping off.

Vaughan's Peonies

5 of a Kind at the 10 Rate—25 of a Kind at the 100 Rate

Prices are F. O. B. Western Springs, Ill., packing charges to be added at cost.

WE HAVE an exceptionally large stock of our own growing. Strictly true to name, all in strong divisions, with from 3 to 5 eyes each.

The figures preceding the varieties are the rating given to them by the American Peony Society.

Peonies in established plantings need to be fed each Spring. A top-dressing of a balanced plant food well worked in will do wonders, but it should be applied early.

in water, making it easier to prepare and use, and to clean from your spray equipment after use.

The growth regulating chemical (hormone) 2, 4 dichlorophenoxyacetic acid, commonly known as 2,4D, is used in varying forms and strengths for horticultural purposes, and has been proved to act as a selective weed killer when sprayed in the proper strength on plants to be destroyed.

Extensive experiments made last summer established the fact that when used correctly, this chemical is harmless to blue grass and red top, which are usually combined in lawn mixtures, and also to fescues. It is not effective against crab grass and may injure bent grasses. It retards the growth of white clover and often kills it.

Tests made in many parts of the country have proved this chemical to be fatal to the following weeds found in lawns: Buttercup, chaerophyllum, chickweed, cinquefoil, cress, dandelion, dichondra, dock, fleabane, gill-over-the-ground, heal-all, henbit, knotweed, lespedeza, lippia, moneywort, mustard, onion, pennywort, pepper-grass, both broad and narrow leaf plantain, pussy-toes, shepherd's purse, speedwell, thistle, veronica and whitlow.

In general it may be said that it rids the average lawn of most weeds, without injuring blue grass, in fact many reports say that following its use blue grass improves in color and vigor.

Bent grass is not always injured but if sprayed when in full growth its leaves may be killed, though new growth in from two to four weeks is probable.

Use Protexall for Most Insects and Diseases

A one-shot spray or dust that protects plants from most insects, fungi and bacteria. From a single package, this post-war formula enables you to apply to both food and ornamental plants in one all-inclusive operation the four most effective materials for combatting plant pests which war-time invention and world-wide tests have approved:

D. D. T., the marvelous insecticide developed by war experience which kills most garden insects, except some aphids, bean beetles, and red spiders.

Rotenone, most effective of the pre-war materials, non-poisonous to animals, but fatal to aphids, bean beetles, and all others which may be unharmed by D. D. T.

Fermate, greatest discovery in fungicides, hitherto unobtainable for gardens, harmless to all plants, and giving complete protection from many pests which resist other materials.

Sulphur, safest and most effective pre-war fungicide, which deals with most troubles which fermate does not.

With this one preparation the amateur gardener can be sure of applying the most effective modern remedy to every case of insect or disease injury which may threaten his garden, whether he grows flowers or food.

To give equal protection, with separate sprays or dusts, it would be necessary for him to keep in stock a contact insecticide, a stomach poison, and at least two remedies for fungi and bacteria. To use these separate materials effectively, he would be obliged to diagnose the trouble which was threatening his plants, and select the correct materials to deal with it, otherwise his effort might be in vain. Even experienced gardeners are often unable to diagnose garden trouble; sometimes there is doubt whether an injury is due to insects or disease. The need for a combined spray and dust has been felt for generations, and many attempts have been made to provide it. With pre-war materials it was difficult to find a

combination which would be fatal to all pests, yet harmless to all plants, which would combine without loss of effectiveness by any constituent and keep in combination without deterioration.

These difficulties have disappeared with the development of Fermate and D.D.T., which became known during the war, and will be made available for general garden use this year for the first time. These materials have such marvelous scope that their limitations are not yet fully known. D.D.T. controls most chewing insects, and many juice drinkers which defy pre-war materials, such as leaf hoppers and flea beetles, and European corn borer. It destroys with amazing effectiveness Japanese beetles, cabbage worms, most caterpillars and beetles, but not the Mexican bean beetle, and some plant aphids but not all. Rotenone, however, will exterminate those against which D.D.T. is ineffective.

Fermate has been chiefly used so far in greenhouse and garden experiments where it has proved harmless to the most delicate plants, and a reliable specific for black spot on roses, leaf spot on chrysanthemums, snapdragon rust, most scale insects, anthracnose of tomatoes and brown rot of cherries. If there are forms of fungi and bacteria which fermate will not touch, then sulphur is added to take care of them. Sulphur used in Protexall is in a form which will not injure any garden plant.

Protexall is prepared in two forms, one for use as a spray, and one for use as a dust. The proportion of each material used in Protexall is scientifically correct, in order to insure maximum effect. Protexall spray is a powder which mixes easily with water. Protexall Dust comes mixed with a spreader and is ready for instant use. It is necessary to order the form you prefer and have the equipment to use, since the spray material does not make an efficient dust, and the dust is prepared with an inert filler, and cannot be used as a spray.

Protexall Spray, 1 oz. package retails at 35c, price per carton of 24, \$5.04; 4 oz. package retails at \$1.00, per carton of 12, \$7.20; 5 lb. package, \$9.00. 1 oz. will make approximately 4 gallons of spraying solution.
Protexall Dust, 1 lb. package retails 75c, price per carton of 24 packages, \$10.80; 4 lb. package retails at \$2.00, per carton of 12, \$15.84; 50 lb. bags each, \$15.00.

New Greenhouse Insecticides

Sodium Selente Makes Plants Poison Insects

Sodium selenate, which Dr. W. E. Blauvelt of Cornell University told a florists' meeting at Cornell University, "is out of the experimental stage," when applied to the soil in a greenhouse bench is absorbed by the plants, and makes them poisonous to insects.

Over 3,000 pounds have been used in 1945, sufficient to treat six million square feet of greenhouse bench area. One treatment of the soil is effective for three to six months.

Not all insects are affected. It works best with soft plants like chrysanthemums, carnations, gladioli, cyclamens, saintpaulias, etc., and has not been found entirely effective on woody plants. It kills red spider and aphids on chrysanthemums and carnations, cyclamen mites on chrysanthemums and saintpaulias, foliar nematodes and midges on chrysanthemums.

Complete instructions for use are sent with the material and must be followed closely. To emphasize the need for care in the use of this new material, we ask all purchasers to sign a release to us of all responsibility for any damage which may be caused. Two forms are available.

Pure Sodium Selenate is a granular powder, very concentrated: One pound treats 1,800 square feet of bench area. This material is completely water-soluble. 100 grams (makes 1 gallon) prepaid \$1.50; per lb., \$4.00. By express, charges collect.

P-40 is two per cent sodium selenate and ninety-eight per cent carrier (superphosphate in the present material). It is a dilute material. Three pounds treat only 100 square feet of bench area. 3 lbs., \$1.50 prepaid; 25 lbs., \$4.25; 50 lbs., \$8.00; 100 lbs., \$14.00, by express, charges collect.

AZOFUME 70 (AZOBENZINE)

The new fumigant for controlling Red Spiders on roses. Price per 5 lb. package, \$10.00; 10 lbs., \$17.50; 25 lbs., \$37.50; 50 lbs., \$62.50; 100 lbs., \$100.00.

Post-War Fungicide

FERMATE. This new fungicide which has been thoroughly tested gives remarkable control of plant diseases, with safety to all plants. Reliable specific for black spot on roses, leaf spot on chrysanthemums, snapdragon rust, anthracnose of tomatoes, and brown rot of cherries. Recommended for use against all fungi and mildews. 10 lbs., \$11.00; 25 lbs., \$25.00, shipped by express, charges collect.

D. D. T.-Yamtox

Use of DDT alone seems to have a tendency to increase the infestation of other insects that it does not control. This may be due to killing off desirable parasites, or freeing them from competition. DDT Yamtox contains the full complement of rotenone necessary for the control of red spiders and other mites, thrips and aphids. The incorporation of 5% DDT in it widens its range of use to the satisfactory control of tarnished plant bug and leaf rollers. Where the plants are easily damaged, or where it is desired to spray open flowers of mums, or to dip the entire plant, as in the case of cyclamen mite, Yamtox DDT sure fits the bill.

Yamtox is a concentration of the active principles of the Yam Bean (*Pachyrhizus erosus*). The Yam Bean affects many insects in much the same manner as Rotenone and seems to be the nearest approach to it. It has been used for centuries in the control of pests on vegetables in some parts of China. In Yamtox the toxic effects of the bean are extracted to make them as available as possible. They are further strengthened by chemicals of proven toxicity. Especially recommended for the control of Plant Lice, Red Spider, Thrip, Cyclamen Mite, Cabbage Worms, and most other insects that are controlled by Rotenone. It is very mild upon Plant Growth and safe to use even on most tender plants. Price per gallon, \$12.00; case of 6-1 gallon cans, \$11.00 per gallon; 30 gal. drum, \$270.00.
